1 Description

This model simulates human ventricular action potentials. This is a simplified version of Priebe-Beuckelmann human ventricular model. This model does not contain dynamic ion concentration calculations and replaces some gating variables with their steady-state values to improve computational efficiency.

Abstract excerpt: *"We introduce a six-variable model obtained by a reformulation of the Priebe-Beuckelmann model of a single human ventricular cell. The reformulated model is 4.9 times faster for numerical computations and it is more stable than the original model."*
